Title : Effect of Pressure on Formation of Intermediate Products of  
Propane Oxidation

Orig Pub : Dokl. AN SSSR, 1956, 108, No 5, 861-863

Abstract : Oxidation of  $C_3H_8$  with air at pressures of 5, 10 and 15 atm was carried out in a stainless steel reactor at 325, 350 and 375°. Increase in pressure above atmospheric favors the formation of alcohols, wherein the amount of  $CH_3OH$  formed exceeds that of  $C_2H_5OH$ . With increase in pressure the yield of alcohols increases. On the basis of a previously proposed scheme of oxidation (Semenov N.N., O nekotorykh problemakh khimicheskoy kinetiki i reaktsionnoy sposobnosti / On Some Problems of Chemical Kinetics and Reactivity /, Publication of the Academy of Sciences USSR, Moscow, 1954), the authors make the assumption that at a high pressure predominate bimolecular reactions of radicals  $C_2H_5O$  and  $CH_3O$  with  $C_3H_8$ , which result in the formation of alcohols.

TITLE: An Investigation of the Accuracy of Intermediate Frequency Amplifiers

PERIODICAL: Nauchnyye doklady vysshey shkoly, Mashinostroyeniye i priborostroyeniye, 1958, Nr 3, pp 190-196 (USSR)

ABSTRACT: This is Part II of a paper of which Part I was published in the preceding number of subject periodical. In this part, the authors present the experimental determination of influence coefficients by the method of converted circuits. Figure 1 shows two graphs of the IF amplifier of the TV set "Start". Figure 2 shows the apparatus used for the experimental determination of the influence coefficients, consisting of a tube voltmeter LB-9, generator GSS-6 and oscilloscope EO-7 for determining the phase by means of Lissajou figures. The final chapter is devoted to methods of adjusting and tuning IF amplifier stages. The authors then summarize the results of their investigations:

Card 1/3

SOV/159-58-3-27/31

An Investigation of the Accuracy of Intermediate Frequency Amplifiers

1) The basic conceptions were formulated for obtaining formulae for calculating the accuracy of intermediate frequency amplifiers, especially for determining the error in the amplitude-frequency characteristic, the irregularity error of the amplification factor and the phase errors of amplifiers; 2) Experimental methods for investigating and calculating of the IF amplifier accuracy; 3) Graphs were presented for influence coefficients; 4) The accuracy of amplifiers was analyzed; 5) Methods for tuning IF amplifiers were developed and equations were obtained describing the tuning processes. The theory developed in this paper and the methods are illustrated by typified IF amplifier networks. For other networks, the calculation results and the analyses will be different. However, the formulae explained in this paper may be used in an analogous manner with great difficulty for other networks, for example, amplifier stages

TITLE: Effect of controlled respiration on oxygen and carbon dioxide levels of the blood

SOURCE: Medycyna weterynaryjna, no. 9, 1965, 525-528

TOPIC TAGS: surgery, anesthesiology, respirator, biochemistry, oximetry

ABSTRACT: Experiments were conducted on 3 groups of dogs to determine whether controlled respiration is equivalent to natural respiration in successive stages of anesthesia and also to determine the effects of hypo- and hyperventilation. Controlled respiration is described as artificial respiration combined with biochemical control of oxygen and carbon dioxide levels of the blood in such a way as to accelerate or retard the normal respiratory cycle during surgery. Basal anesthesia was induced in the experimental animals by chlorpromazine (0.1 mg), atropine (0.5 mg) and dolatine (50-100 mg). A tracheal tube was inserted during narcosis produced with barbiturates. Natural respiration of animals was inhibited with a curarizing agent (Flaksedil 0.3 mg/kg) in 15-20 min. A "Cato" machine (made by Drager) was used to

Card 1/2

09016828

L 5272-66

ACC NR: AP5027493

control respiration. Air was pumped into the lungs at the rate of 6 cycles/min for the first group, 8 cycles/min for the second group, and 10 cycles/min for the third group. Oxygen and carbon dioxide levels of blood drawn from the hind-leg vein were determined with a Van Slyke apparatus at various stages of the experiment. Findings show that controlled respiration can be substituted for natural respiration in all three groups of animals despite different oxygen and carbon dioxide levels of the venous blood. In all cases natural respiration was restored as soon as the drugs affecting the respiratory muscles ceased to act. Oxygen and carbon dioxide levels of the blood closest to the physiological norms were found in the first group. Hyperventilation began to appear in the first group during the 20th minute of controlled respiration, and in the second and third groups it appeared as early as the 5th minute and continued to increase. Hyperventilation apparently depends on length of the controlled respiration period and on ventilation frequency. With biochemical control of the oxygen and carbon dioxide levels during anesthesia, controlled respiration ensures proper lung ventilation. Orig. art. has: 1 figure and 1 table. [06]

AUTHOR: Badura, Ryszard (Docent; Doctor); Modrakowski, Andrzej--Modrakowski, A.; 10 Osinski, Bogdan--Osin'ski, B.; Utzig, Jozef--Utzig, I.ORG: Department of Surgeryheaded by Docent, Doctor Ryszard Badura/, Veterinary Faculty, WSR, Wroclaw (Katedra Chirurgii Wydziału Wet. WSR)TITLE: Effect of controlled breathing on blood oxygen and carbon dioxideSOURCE: Medycyna weterynaryjna, no. 9, 1965, 525-528TOPIC TAGS: biologic respiration, blood chemistry, dog

ABSTRACT: The effect of controlled breathing on the content of oxygen, and carbon dioxide in the venous blood of dogs for various speeds of breathing was investigated. It was found that healthy dogs in which their own breathing was replaced by controlled breathing endure the slight hyperventilation of 5-20 minutes well, and that there is a certain tolerance to variation in the amount of O<sub>2</sub> and CO<sub>2</sub> in the blood causing an excess of physiological norms. The values nearest to the physiological norms were found, in the authors' investigations, in the fifth minute of controlled breathing when air was being pumped 6 times per minute. Orig. art. has: 1 figure and 1 table. [Based on authors' Eng. abst.] [JPRS: 33,500]

Title : Adenoma of the Prostate of a Dog.

Orig Pub : Med. weteryn., 1957, 13, No. 12, 725-727

Abstract : In a 10-year-old male dog, a progressively-growing tumor was discovered in the abdominal cavity over the urinary bladder. Pathohistologically, a cystoadenoma of the prostate was diagnosed.

6230. EXPERIMENTAL FAT EMBOLI AND TRIAL TREATMENT WITH PENDIOMID AND HEPARINE - Doświadczalny zator tłuszczy i próba jego leczenia pendiomidem i heparyną - Badura R. and Człowski T. Weter. Klin. Chir., Wrocław; Chir. Oddz. Okręgowego Szpitala Wojskowego, Wrocław - POL. PRZEGŁ. CHIR. 1958, 30/12 (1177-1173) Illus. 5  
Experiments were carried out on 2 groups of dogs. The control group was given 30 ml. of lipiodol i.v.; the animals died in 24 hr., showing symptoms of pulmonary oedema. On the assumption that pendiomid has an anti-shock action, and that heparin takes part in the activation of lipase, after administering lipiodol to the 2nd group, of dogs, the authors injected 50 ml. of pendiomid and 5000 U. of heparin i.v. every 12 hr. for 3 days. All the animals in this group survived. Although the experimental material is small, the authors conclude that the administration of pendiomid and heparin for fat emboli in the clinic is completely justified.

I. J. S. Prospects of Replacing Oak Guides by Pine Guides.

"Możliwość zastąpienia prowadników dębowych sosnowymi". Przegląd Górnictwa, No 3, 1951, pp. 93-94, 7 fig.

Research carried out reveals that pine guides can be advantageously used instead of oak guides, although only in shafts having a low number of cage trips. The life of such guides in shafts for the transport of material and in stope shafts varies from 4 to 6 years, and quite often even considerably more. It is possible to use pine guides in coil hoisting shafts which are not distorted, provided the effective safety factors for compression and buckling are adhered to. Method of checking the safety factor. Advantages and disadvantages of pine guides.

✓ 4922. EXCESSIVE WEAR OF WOODEN SHAFT GUIDES. Badura, S. (Pisegl. gorn. (Min. Rev.), Nov. 1954, vol. 10, 367-370). The principal causes of excessive wear of wooden shaft guides, such as aging of the wood, faulty joining of the guides to the shaft buntons, crookedness of the guides themselves, excessive moisture leading to rotting and warping of the timber and use of unsuitable kinds of timber, are discussed. Practical measures for dealing with these problems are suggested. (L) N.C.B.

pri proyektirovaniyu samoletov. 12-19.

TEXT: The most economic number of engines in a civil main line airliner is discussed on the assumption that engines are situated at the tail which permits an odd number to be chosen. Independent power plants, a specific engine weight independent of size and a negligible chance of more than one power unit failure during the same flight are assumed. The cruising speed and altitude, the take-off run and the angle of climb or rate of climb with one power unit inoperative are given. These values yield a definite ratio of static thrust to take-off weight. The minimum angle of climb determines the choice of the number of power units depending on the cruising speed and the length of the take-off run. The static thrust to weight ratio is derived first from the equation of the take-off run and then from the given cruising speed.

Card 1/2

On the number of turbojet engines ...

S/535/61/000/138/002/008  
E191/E135

Introducing the minimum rate of climb with one power unit inoperative and the minimum angle of climb, a formula is obtained which contains only the number of power units as the unknown variable. The numerical results are plotted in graphs of the cruising speed against the take-off run. Each number of power units represents one curve of the family. Graphs are given for aspect ratios of 6 and 7. A larger number of power units corresponds to higher cruising speeds and longer take-off runs. The cost per ton mile is stated to diminish over a stage length of 2500 km as the number of power units decreases. There are 3 figures, 2 tables and 3 English references. The English language references read as follows:

TEXT: A subsonic trunk route civil aircraft of about 25-30 tons is examined. A general criterion, based on freight cost, is developed for the determination of the fineness ratio for a fuselage, with indirect references to aerodynamic and weight characteristics of the fuselage and other parts of the aircraft. The effect of the tailplane parameters is also taken into consideration. The problem is presented as follows. Given the take-off weight and engine characteristics, determine the fineness ratio of the fuselage for a suitable minimum freight cost for (1) given fuselage volume, and (2) given floor area. The resulting fineness ratio is said to be rational. It is assumed that the static moments of the tailplane and fin, and the specific weight
